Evaluation of Delayed Dormant Copper to Reduce Inoculum of *Erwinia amylovora* in Bartlett Pears

Rachel Elkins, Ken Johnson, Todd Temple, Franz Niederholzer, Steve Lindow, Broc Zoller and Bill Oldham

## Why did we do this?

- old recommendation (green tip)
- based on counting strikes only (early-mid 1900's)
- new interest due to resistance to antibiotics, new copper materials (e.g. Kocide 3000)
- LAMP available to determine presence of bacteria on blossoms *rapidly*

### 2010 Trial

- 3 orchards in Sutter County (Sacramento Valley)
- 5 orchards in Lake County
- treated vs. untreated blocks (4-5 acres)
- Kocide 3000 applied at bud swell (just before green tip – slightly earlier than old literature/recommendations), 6 lbs./acre
- blossom samples mid-bloom, full bloom, petal fall (2x in Lake) to OSU for LAMP
- russet samples pre-harvest to Lindow lab (none)
- blight counts in early July (only holdovers in 2010)

Percent positive 100-cluster flower LAMP samples and average Log10 *E. amylovora* CFU per flower at mid-bloom, full bloom, and petal fall, 2010.

#### **Bloom Stage (Avg. no./30 samples per sample date)**

| Treat        | Freatment       |                         | Mid bloom<br>3/22-25/10<br>(n=29) | Full<br>Bloom<br>3/29-4/1 |                   | Petal Fall 1<br>4/16-26 |                   | Petal Fall 2<br>5/12<br>(n=5) |                       | Total<br>n=95 |                   |

#### LAMP detection of *E. amylovora* over 3 years and correlation with Cougarblight model

Correlation with LAMP samples with Degree hours (base 65 degrees) and presence of *E.amylovora* 

### Conclusions

- appears (statistical *trend only*) that delayed dormant copper may help
- need more orchards tested (2011 goal)
- LAMP a good tool to confirm bacterial presence (shows need to keep spraying at/past petal fall?!)
- will use cheaper copper in 2011 (2010 costs = 2 antibiotic sprays, but 2011 antibiotic prices will be higher)
